

NOVEL QUINUCLIDINE CARBAMATE DERIVATIVES AND MEDICINAL  
COMPOSITIONS CONTAINING THE SAME

5 This invention relates to new therapeutically useful quinuclidine carbamate derivatives, to some processes for their preparation and to pharmaceutical compositions containing them.

10 The structures according to the invention are antimuscarinic agents with a potent and long lasting effect. In particular, these compounds show high affinity and selectivity for muscarinic M3 receptors over M2 receptors. The M3 subtype of muscarinic receptor is present in glands and smooth muscle and mediates the excitatory effects of the parasympathetic system on glandular secretion and on the contraction of visceral smooth muscle (Chapter 6, *Cholinergic Transmission*, in H.P. Rang et al., *Pharmacology*, Churchill Livingstone, New York, 1995).

15 M3 antagonists are therefore known to be useful for treating diseases characterised by an increased parasympathetic tone, by excessive glandular secretion or by smooth muscle contraction (R.M. Eglen and S.S. Hegde, (1997), *Drug News Perspect.*, 10(8):462-469).

20 Examples of this kind of diseases are respiratory disorders such as chronic obstructive pulmonary disease (COPD), bronchitis, bronchial hyperreactivity, asthma, cough and rhinitis; urological disorders such as urinary incontinence, pollakiuria, neurogenic or unstable bladder, cystospasm and chronic cystitis; gastrointestinal disorders such as irritable bowel syndrome, spastic colitis, diverticulitis and peptic ulceration; and cardiovascular disorders such as vagally induced sinus bradycardia (Chapter 7, *Muscarinic Receptor Agonists and Antagonists*, in *Goodman and Gilman's The Pharmacological Basis of Therapeutics*, 10th edition, McGraw Hill, New York, 2001).

30 The compounds of the invention can be used alone or in association with other drugs commonly regarded as effective in the treatment of these diseases. For example, they can be administered in combination with  $\beta_2$ -agonists, steroids, antiallergic drugs, phosphodiesterase IV inhibitors and/or leukotriene D4 (LTD4) antagonists for simultaneous, separate or sequential use in the treatment of a respiratory disease.

35

The present invention provides new quinuclidine carbamate derivatives with potent antagonist activity at muscarinic M3 receptors, which fall under the chemical structure described in formula (I) or are pharmaceutically acceptable salts thereof, including quaternary salts of formula (II).

Formula (I) represents a carbamate of the following general structure:

wherein

R1 represents a group selected from phenyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, benzyl, furan-2-ylmethyl, furan-3-ylmethyl, thiophen-2-ylmethyl, and thiophen-3-ylmethyl;

R2 represents a group selected from optionally substituted lower alkyl, optionally substituted lower alkenyl, optionally substituted lower alkynyl, saturated or unsaturated cycloalkyl, saturated or unsaturated cycloalkylmethyl, phenyl, benzyl, phenethyl, furan-2-ylmethyl, furan-3-ylmethyl, thiophen-2-ylmethyl, thiophen-3-ylmethyl, pyridyl, and pyridylmethyl; wherein the carbocyclic moieties in the cycloalkyl, cycloalkylmethyl, phenyl, benzyl or phenethyl groups can be optionally bridged or fused to another saturated, unsaturated or aromatic carbocyclic moiety or to a cyclic moiety comprising carbon atoms and 1 or 2 oxygen atoms;

the cyclic groups present in R1 and R2 being optionally substituted by one, two or three substituents selected from halogen, straight or branched, optionally substituted lower alkyl, hydroxy, straight or branched, optionally substituted lower alkoxy, -SH, straight or branched optionally substituted lower alkylthio, nitro, cyano, -NR'R'', -CO<sub>2</sub>R', -C(O)-NR'R'', -N(R''')C(O)-R', -N(R''')-C(O)NR'R'', wherein R', R'' and R''' each independently represents a hydrogen atom or a straight or branched, optionally substituted lower alkyl group or R' and R'' together with the atom to which they are attached form a cyclic group;

p is 1 or 2 and the carbamate group is attached at positions 2, 3 or 4 of the azabicyclic ring,

## Ethylphenylcarbamic acid 1-azabicyclo[2.2.2]oct-3-yl ester

Further objectives of the present invention are to provide processes for preparing said compounds; pharmaceutical compositions comprising an effective amount of said compounds; the use of the compounds in the manufacture of a medicament for the treatment of diseases susceptible of being improved by antagonism of M3 muscarinic receptors; and methods of treatment of diseases susceptible to amelioration by antagonism of M3 muscarinic receptors, which methods comprise the administration of the compounds of the invention to a subject in need of treatment.

In the compounds of the invention it is preferred that at least one of R1 or R2 be substituted. Particularly preferred compounds of formula (I) or (II) are those wherein when the cyclic group present in R1 is unsubstituted or has only one substituent R2 has at least one substituent. Also preferred are compounds wherein when R2 is not substituted the cyclic group present in R1 has at least two substituents.

The present invention also provides processes for preparing compounds of formulas (I) and (II).

Compounds of general formula (I) may be prepared by method (a) illustrated in the following scheme and detailed in the experimental section.

In formulas (I), (III) and (IV), R1, R2 and p are as defined above.

Compounds of general formula (III) may be prepared from the corresponding secondary amines following the standard method (b) described in literature.

Amines of general formula (V) that are not commercially available may be prepared by synthesis according to standard methods, such as alkylation of anilines or reductive alkylation. For example, amines wherein R1 is a substituted thiophen-2-ylmethyl or a substituted furan-2-ylmethyl and R2 is as defined above, may be obtained by reductive alkylation. The corresponding aldehyde is treated with the corresponding primary amine to form the imine, which is reduced with sodium borohydride in MeOH to obtain the secondary amine.

The carbamates of formula (I) may be converted to pharmaceutically acceptable salts by methods known in the art. Typically, a carbamate of formula (I) is treated with an inorganic or organic acid such as fumaric, tartaric, formic, succinic or hydrochloric acid.

The quaternary ammonium derivatives of general formula (II), may be prepared by reaction of an alkylating agent of general formula (VI) with compounds of general formula (I), as described in the following scheme. In formulas (I), (II) and (VI), R1, R2, A, B, X, n, m and p are as defined above.

In formula (VI), W represents any suitable leaving group, such as a group X as defined above. Preferably, W represents a group X.

15 This alkylation reaction may be carried out by two different experimental procedures, (c) and (d) which are described in the experimental section below. In particular method (d) provides a new experimental process, using solid phase extraction methodologies that allow the parallel preparation of several compounds. If W represents a group other than X, the quaternary ammonium salt of formula (II) is produced from the product of method (c) or (d) by carrying out an exchange reaction according to standard methods to replace the anion  $W^-$  with the desired anion  $X^-$ .

20 Methods (c) and (d) are described in the experimental section. Compounds of general formula (VI) which are not commercially available have been prepared by synthesis according to standard methods. For example, compounds wherein  $n = 0$  and

A= -O-, -S- or -NR<sub>4</sub>, wherein R<sub>4</sub> is as defined above, were obtained by reaction of the corresponding alcohol, thiol or amine derivative or its sodium or potassium salt with an alkylating agent of general formula Y-(CH<sub>2</sub>)<sub>m</sub>-W, wherein W may be a halogen and Y may be a halogen or a sulphonate ester. In other examples, compounds of general formula (VI), where n>=1 were synthesised from the corresponding alcohol derivative of general formula (VII) by known methods.

(VII)

Compounds of formula (IV) could be:

- 4-hydroxy-1-azabicyclo[2.2.1]heptane, described in WO93/15080
- 4-hydroxy-1-azabicyclo[2.2.2]octane, described in Grob, C.A. et.al. *Helv.Chim.Acta* (1958), 41, 1184-1190
- (3R)-3-hydroxy-1-azabicyclo[2.2.2]octane or (3S)-3-hydroxy-1-azabicyclo[2.2.2]octane, described in Ringdahl, R. *Acta Pharm Suec.* (1979), 16, 281-283 and commercially available from CU Chemie Uetikon GmbH.

The structures of the prepared compounds were confirmed by <sup>1</sup>H-NMR and MS. The NMR were recorded using a Varian 300 MHz instrument and chemical shifts are expressed as parts per million (δ) from the internal reference tetramethyl silane.

- Their purity was determined by HPLC, using reverse phase chromatography on a Waters instrument. Molecular ions were obtained by electrospray ionization mass spectrometry on a Hewlett Packard instrument. HPLC-MS experiments were performed on a Gilson instrument equipped with a binary pump (Gilson piston pump 321); a vacuum degasser (Gilson 864); an injector-fraction collector (Gilson liquid handler 215); two injection modules, analytical and preparative (Gilson 819); a valve (Gilson Valvemate 7000); a 1/1000 splitter (Acurate by LC Packings); a make-up pump (Gilson 307); a diode array detector (Gilson 170) and a MS detector (a Thermoquest Finnigan aQa, a quadrupole mass spectrometer with ES and APCI ionisation modes). The HPLC-MS instrument was controlled by an IBM PC.

**Preparation of butylphenylcarbamic acid (3R)-1-azabicyclo[2.2.2]oct-3-yl ester.**

0.65 g (28.50 mmol) of sodium was added to 70 ml of dry toluene. The suspension was refluxed with vigorous stirring. When all the sodium was melted, 3.60 g (28.30 mmol) of (3R)-3-hydroxy-1-azabicyclo[2.2.2]octane was added and stirring continued for 2 hours, by which time all the sodium had reacted to form the alcoholate. 6.00 g (28.30 mmol) of Phenylbutylcarbamoyl chloride (Intermediate I-1) dissolved in 30 ml of toluene was then slowly added. The mixture was refluxed for one hour, and then the reaction was stirred overnight at room temperature. The suspension was filtered and the filtrate evaporated. Ether was added to the residue and stirred for 10 min. The suspension was filtered and the filtrate concentrated in vacuo to obtain 7.18 g of brown oil. This product was purified by column chromatography (silica gel, chloroform/ethanol/ammonia 140:8:1) to yield 1.78 g (5.89 mmol) (22%) of a pure product, structure confirmed by <sup>1</sup>H-NMR.

<sup>1</sup>H-NMR (300 MHz, CDCl<sub>3</sub>): δ 0,9 (m, 3H), 1,3 (m, 4H), 1,5 (m, 4H), 1,9 (s, 1H), 2,7 (m, 5H), 3,2 (m, 1H), 3,7 (m, 2H), 4,7 (m, 1H), 7,2-7,4 (m, 5H); MS [M+1]<sup>+</sup> : 303.

**Example 2****Preparation of cyclopentylthiophen-2-ylmethylcarbamic acid (3R)-1-azabicyclo[2.2.2]oct-3-yl ester.**

0.57 g (24.59 mmol) of sodium was added to 70 ml of dry toluene. The suspension was refluxed with vigorous stirring. When all the sodium was melted, 3.11 g (24.42 mmol) of (3R)-3-hydroxy-1-azabicyclo[2.2.2]octane was added and stirred for 2 hours, by which time all the sodium had reacted to form the alcoholate. 4.96 g (20.35 mmol) of cyclopentylthiophen-2-ylmethylcarbamoyl chloride (Intermediate I-2) dissolved in 30 ml of toluene was then slowly added. The mixture was refluxed for five hours, and then the reaction was stirred overnight at room temperature. The suspension was filtered and the filtrate washed with water. The organic layer was extracted with 20 % HCl and the aqueous layer basified with 8N NaOH and extracted with ethyl acetate. The organic layer was washed with water, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and evaporated. The oil obtained (4.50 g) was purified by column chromatography (silica gel, chloroform/ethanol/ammonia 225:8:1) to obtain 2.25 g (6.73 mmol) (33%) of a pure product, structure confirmed by <sup>1</sup>H-NMR.

**Preparation of Benzylphenylcarbamic acid 1-azabicyclo[2.2.1]hept-4-yl ester**

In a two necked flask under nitrogen, 3 ml of THF and 150 mg (1.33 mmoles) of 4-hydroxy-1-azabicyclo[2.2.1]heptane were placed. The suspension was cooled to  $-60^{\circ}\text{C}$  and 0.7 ml (1.46 mmoles) of LDA was added dropwise. After the addition the temperature was allowed to rise to  $0^{\circ}\text{C}$  and was kept during two hours. A solution of 295 mg (1.20 mmoles) of benzylphenylcarbonyl chloride in 2 ml of THF was added in 30 minutes. The residue was extracted with dichloromethane and water. The organic layer was extracted with 2N HCl and the aqueous layer basified with 8N NaOH and extracted with dichloromethane. The organic layers were dried over anhydrous  $\text{Na}_2\text{SO}_4$  and evaporated. The oil obtained (162 mg) was purified by HPLC-MS to obtain 4.86 mg (0.015 mmoles) 1.3% of a pure product as a formate, structure confirmed by  $^1\text{H-NMR}$ .

0.69 g (30 mmol) of sodium (in small portions) were added to 140 ml of dry toluene and the suspension was refluxed with vigorous stirring. When all the sodium was melted, 3.78 g (29.73 mmol) of (3R)-3-hydroxy-1-azabicyclo[2.2.2]octane were added in five portions, and the suspension obtained was refluxed for 2 hours, by which time all the sodium had reacted to form the alcoholate. A solution of 8.11 g (25.85 mmol) of m-Tolyl-(2,4,5-trifluorobenzyl)carbonyl chloride (Intermediate I-3) in 60 ml of toluene was then slowly added. The mixture obtained was refluxed for 3 hours, and stirred at room temperature for 64 more hours. ### Pharmacological Action

The following examples demonstrate the excellent pharmacological activities of the compounds of the present invention. The results on human muscarinic receptor binding and in the test on bronchospasm in guinea pig, were obtained as described below.

### Human muscarinic receptor studies.

The binding of [ $^3$ H]-NMS to human muscarinic receptors was performed according to Waelbroeck et al (1990), Mol. Pharmacol., 38: 267-273. Assays were  
5 carried out at 25°C. Membrane preparations from stably transfected Chinese hamster ovary-K1 cells (CHO) expressing the genes for the human muscarinic M3 receptors were used.

For determination of  $IC_{50}$ , membrane preparations were suspended in DPBS to  
10 a final concentration of 89  $\mu$ g/ml for the M3 subtype. The membrane suspension was incubated with the tritiated compound for 60 min. After incubation the membrane fraction was separated by filtration and the bound radioactivity determined. Non specific binding was determined by addition of  $10^{-4}$  M atropine. At least six concentrations were assayed in duplicate to generate individual displacement curves.  
15 Our results show that the compounds of the present invention have high affinities for muscarinic M3 receptors. Preferred compounds of the invention have an  $IC_{50}$  (nM) value for M3 receptors of less than 35 nM, most preferably less than 10 nM.

The preferred compounds of the invention also show high selectivity for M3  
20 receptors with respect to M2 receptors. Thus, the ratio  $IC_{50}$  M2 /  $IC_{50}$  M3 is higher than 5, preferably higher than 10, most preferable higher than 15.

### Test on bronchospasm in guinea pig

The studies were performed according to H. Konzett and F. Rössler (1940),  
25 Arch. Exp. Path. Pharmacol. 195, 71-74. Aqueous solutions of the agents to be tested were nebulized and inhaled by anaesthetized ventilated male guinea pigs (Dunkin-Hartley). Bronchial response to intravenous acetylcholine challenge was determined before and after drug administration and changes in pulmonary resistance at several time-points were expressed as percent of inhibition of bronchospasm.

30

The compounds of the present invention showed bronchodilator activity with high potency and a long duration of action.

From the above described results one of ordinary skill in the art can readily  
35 understand that the compounds of the present invention have excellent antimuscarinic activity (M3) and thus are useful for the treatment of diseases in which the muscarinic M3 receptor is implicated, including respiratory diseases such as chronic obstructive

The present invention further provides a compound of formula (I) or (II) or a pharmaceutically acceptable composition comprising a compound of formula (I) or (II) for use in a method of treatment of the human or animal body by therapy, in particular for the treatment of respiratory, urinary or gastrointestinal disease.

The present invention further provides the use of a compound of formula (I) or (II) or a pharmaceutically acceptable composition comprising a compound of formula (I) or (II) for the manufacture of a medicament for the treatment of respiratory, urinary or gastrointestinal disease.

Further, the compounds of formula (I) or (II) and pharmaceutical compositions comprising a compound of formula (I) or (II) can be used in combination with other drugs effective in the treatment of these diseases. For example with  $\beta_2$  agonists, steroids, antiallergic drugs, phosphodiesterase IV inhibitors and/or leukotriene D4 (LTD4) inhibitors, for simultaneous, separate or sequential use in the treatment of a respiratory disease.

Compound of the present invention .....	5.0 mg
Lactose.....	113.6 mg
Microcrystalline cellulose.....	28.4 mg
Light silicic anhydride.....	1.5 mg
Magnesium stearate.....	1.5 mg

Using a mixer machine, 15 g of the compound of the present invention was mixed with 340.8 g of lactose and 85.2 g of microcrystalline cellulose. The mixture was subjected

to compression moulding using a roller compactor to give a flake-like compressed material. The flake-like compressed material was pulverized using a hammer mill, and the pulverized material was screened through a 20 mesh screen. A 4.5 g portion of light silicic anhydride and 4.5 g of magnesium stearate were added to the screened material and mixed. The mixer product was subjected to a tablets making machine equipped with a die/punch system of 7.5 mm in diameter, thereby obtaining 3,000 tablets each having 150 mg in weight.
